## 1. PRODUCT NAME

Hitachi Rotary Hammer, Model DH 24PC3

## 2. MARKETING OBJECTIVE

The new Model DH 24PC3 is a 3-mode type rotary hammer based on the Model DH 24PB3 rotary hammer drill. It features the "hammering only" mode that is available for chipping and groove digging in addition to the "rotation + hammering" mode and the "rotation only" mode. The Model DH 24PC3 is equipped with the variable lock mechanism that is available in the "hammering only" mode. With the variable lock mechanism, the tip angle of a cold chisel or other tool is selectable from 36 levels.

The main features of the Model DH 24PC3 are as follows:

- (1) Class-top drilling speed
- (2) More comfortable and frisky drilling
- (3) Long service life and high durability thanks to the internal pressure adjustment mechanism
- (4) Non-slip double-layer molded handle and gear cover
- (5) New and powerful design aiming at iF design award

## 3. APPLICATIONS

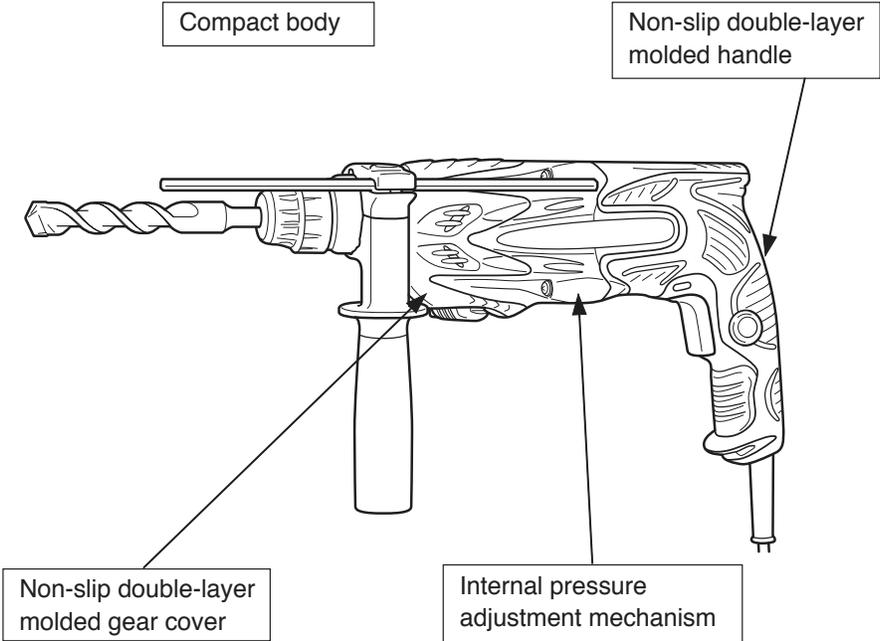

- (1) Rotation and hammering function
  - Drilling anchor holes
  - Drilling holes in concrete, tile, brick and similar materials
- (2) Rotation only function
  - Drilling holes in steel and wood (with chuck adapter)
  - Tightening and loosening machine screws and wood screws (with chuck adapter)
- (3) Hammering only function
  - Light-duty chiselling of concrete
  - Groove digging and edging

[Typical applications]

- Air conditioning ..... Installation of air conditioners, water coolers and heaters, and air ducts
- Piping and plumbing ..... Installation of gas, water, and sanitary facilities
- Electrical work ..... Installation of light fixtures and various electric appliances
- Interior decoration ..... Installation of seating , display stands and partitions
- Other civil engineering, construction and repair work

**4. SELLING POINTS**

- Class-top drilling speed
- More comfortable and frisky drilling
- New and powerful design

## 4-1. Selling Point Descriptions

### 4-1-1. Selectable from 3 modes, "rotation + hammering", "rotation only" and "hammering only"

The new Model DH 24PC3 is a 3-mode type rotary hammer based on the Model DH 24PB3 rotary hammer drill (2-mode type). It features the "hammering only" mode in addition to the "rotation + hammering" mode and the "rotation only" mode. The "hammering only" mode is available not only for light-duty chipping by means of bull points but also for groove digging and edging by means of cold chisels and cutters for various applications.

### 4-1-2. Variable lock mechanism

With the variable lock mechanism, the tip angle of a tool such as a cold chisel or a cutter is selectable from 36 levels and can be locked in the "hammering only" mode. Thus the tip of a tool can be properly positioned according to the application.

### 4-1-3. Class-top drilling speed

The drilling speed of the Model DH 24PC3 is 1.4 times higher than B and 1.2 times higher than C thanks to the efficient transmission of the hammering energy.

### 4-1-4. More comfortable and frisky drilling

The Model DH 24PC3 can drill holes more comfortably and friskily with a light pushing force because the quantity of body jumping is 20% less than C.

### 4-1-5. Internal pressure adjustment mechanism

By minimizing variations in the internal pressure during operation, hammering operation is stabilized. In addition, idling and grease leakage can be prevented.

### 4-1-6. Non-slip double-layer molded gear cover

The double-layer molded gear cover consists of a plastic resin base covered with a soft resin to ensure ease of operation and a non-slip grip during chipping.

### 4-1-7. Non-slip double-layer molded handle

The double-layer molded handle consists of a plastic resin base covered with a soft resin to ensure a soft-touch and non-slip grip.

### 4-1-8. Compact body: Entire length 351 mm

The Model DH 24PC3 has the same helical driving structure as the Model DH 24PC2 to make the entire length as short as possible to 351 mm. The Model DH 24PC3 has the shortest body in the class.

Maker/Model	Entire length (mm)

38 (1-1/2")	982676		

(4) Core bit shank (SDS-plus shank)

Core bit shank (A)	Core bit (outer diameter) 25 – 38 mm (31/32" – 1-1/2")	Overall length 105 mm (4-1/8")	Code No. 303625
		Overall length 300 mm (11-52/64")	Code No. 303626
Core bit shank (B)	Core bit (outer diameter) 45 – 50 mm (1-25/32" – 2")	Overall length 300 mm (11-52/64")	Code No. 303627

D. Bolt placing operations with chemical anchor (rotation + hammering)

+

(Standard sockets available on the market) 12.7 mm (1/2") Chemical anchor adapter (SDS-plus shank)  
19 mm (3/4") Chemical anchor adapter (SDS-plus shank)

Part name	Code No.
12.7 mm (1/2") Chemical anchor adapter	303044
19 mm (3/4") Chemical anchor adapter	303045

E. Crushing operations (hammering only)

Bull point (round type)  
(SDS-plus shank)

Code No. 303046

Square bull point  
(SDS-plus shank)

Code No. 316656

F. Groove digging and edging (hammering only)

Cold chisel  
(SDS-plus chank)

Code No. 316657

Cutter  
(SDS-plus shank)

Code No. 316658

G. Grooving (hammering only)

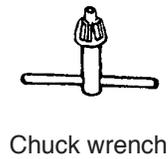

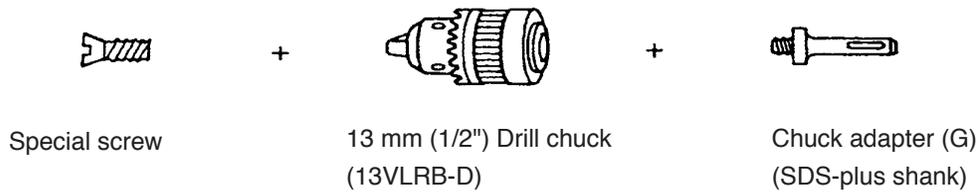

Grooving chisel  
(SDS-plus shank)

Code No. 316659

H. Drilling hole and driving screws (rotation only)

- Drill chuck, chuck adapter (G), special screw and chuck wrench

(Note)

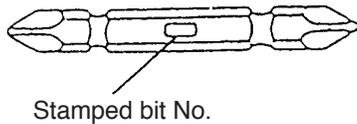

If the tool is to be used for loosening screws, open the three jaws of the drill chuck and securely fix the drill chuck to chuck adapter (G) with the special screw (a left-hand threaded M6 screw) when mounting the drill chuck onto chuck adapter (G).

	Part name	Code No.
a.	Chuck adapter (G) for SDS-plus shank system	303623
b.	13 mm (1/2") Drill chuck 13VLRB-D (with chuck wrench)	321814
c.	Special screw (M6 left-hand threaded)	981122

(1) Cross-recessed head (Phillips) bit

[Overall length: 70 mm]

(For use with cross-recessed head (Phillips) screw)

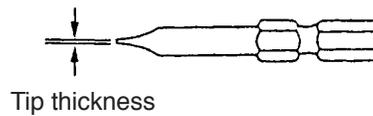

Bit No.	Code No.	Applicable screw dia. (mm)
No. 2	955654	4 – 5
No. 3	955655	6 – 8

(2) Slotted-head (minus) bit

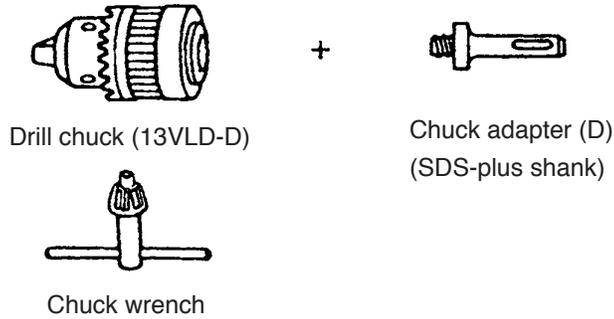

[Overall length: 50 mm]

(For use with slotted-head (minus) screw)

Bit tip thickness	Code No.	Applicable screw dia. (mm)
0.8	955658	4
1	955673	5 – 6

I. Drilling hole (rotation only) ... For drilling holes in steel and wood

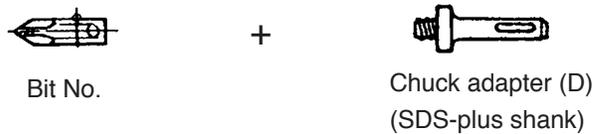

(NOTE)

The 13VLD-D drill chuck and chuck adapter (D) cannot be used for reverse rotation. If reverse rotation is to be used for loosening screws, use the plus bit (Bit No. 2) described below by attaching it directly to chuck adapter (D).

Part name	Code No.
Chuck adapter (D) (for SDS-plus shank type)	303624
13 mm (1/2") Drill chuck 13VLD-D (with chuck wrench)	321813

J. Drilling screws (rotation only)

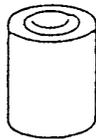

- Plus driver bit [overall length: 25 mm] (for cross-recessed head screws)

Bit No.	Screw size	Code No.
No. 2	3 – 5 mm	971511Z
No. 3	6 – 8 mm	971512Z

K. Grease for electric impact drill

230 V	HITACHI	DH 24PC3							32
	HITACHI	DH 24PC2							31
	B								20
	C								27

Fig. 2

## 7. PRECAUTIONS IN SALES PROMOTION

In the interest of promoting the safest and most efficient use of the Model DH 24PC3 Rotary Hammer by all of our customers, it is very important that at the time of sale the salesperson carefully ensures that the buyer seriously recognizes the importance of the contents of the Handling Instructions, and fully understands the meaning of the precautions listed on the Caution Plate attached to each tool.

### 7-1. Handling Instructions

Although every effort is made in each step of design, manufacture and inspection to provide protection against safety hazards, the dangers inherent in the use of any electric power tool cannot be completely eliminated. Accordingly, general precautions and suggestions for the use of electric power tools, and specific precautions and suggestions for the use of the Rotary Hammer are listed in the Handling Instructions to enhance the safe, efficient use of the tool by the customer. Salespersons must be thoroughly familiar with the contents of the Handling Instructions to be able to offer appropriate guidance to the customer during sales promotion.

### 7-2. Caution Plate

The Model DH 24PC3 unit is provided with a Caution Plate (illustrated below) which lists basic safety precautions in use. Carefully ensure that the customer fully understands and follows these precautions before using tool.

For Australia and New Zealand

**CAUTION**  
● Read thoroughly **HANDLING INSTRUCTIONS**  
before use.

For the U.S.A. and Canada

**-WARNING-** ● To reduce the  
risk of injury, user must read and  
understand instruction manual.  
**AVERTISSEMENT** ● Afin de réduire le risque  
de blessures, l'utilisateur doit  
lire et bien comprendre le mode d'emploi.

## 8. REFERENCE MATERIAL

### 8-1. Lubrication

It is not necessary to replenish the grease lubricant unless the tool is disassembled or there is grease leakage due to a defective seal. Special grease is used in the striking section. Should the striking section (within the gear cover) be disassembled, carefully remove the old grease from all parts and, on reassembly, inject 45 g (1.6 oz) of new grease into the gear cover and 5 g (0.2 oz) into the groove of the inner cover. Be careful not to exceed the designated amount of grease. Excessive grease will reduce striking efficiency. Apply Molub Alloy No. 777-1 grease to the pin portion of the change lever.

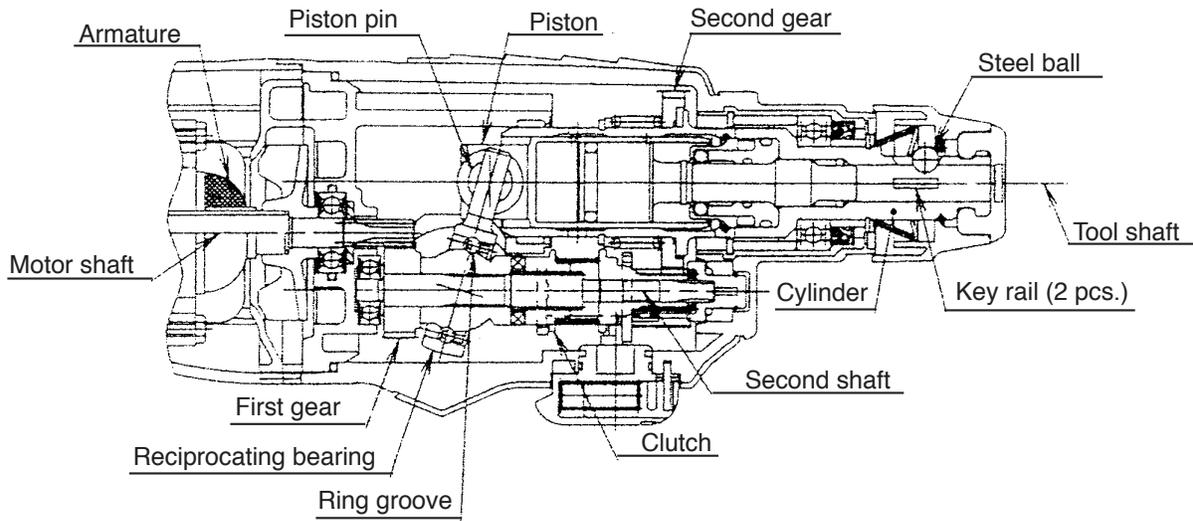

### 8-2. Tool Structure

- Transmission of rotation

Unlike conventional hammer drills, the armature shaft in the Model DH 24PC3 is in parallel with the tool shaft - the same structure that is employed in most impact drills. This structure was adopted in order to make the Model DH 24PC3 more compact for easier handling and operation. Thus, the appearance of the Model DH 24PC3 is similar to that of an impact drill. The rotation of the armature is transmitted to the second shaft via the first gear, and causes it to rotate. The second pinion provided on the second shaft engages the second gear mounted on the outer circumference of the cylinder. The cylinder is coupled to the second gear by means of a slip mechanism, and they rotate together. The end of the cylinder also functions as the drill bit retainer. The cylinder is key-connected to the inserted drill bit by means of two key rails, and transmits rotation to the drill bit. A steel ball is used to prevent the bit from coming off.

- Piston reciprocating mechanism

In conventional rotary hammers, a piston is caused to reciprocate by a connecting rod and crank shaft, and the crank shaft and the cylinder axes are at right angles to each other. Accordingly, the armature shaft and the cylinder axes are also at right angles to each other. In the Model DH 24PC3, through adoption of a spiral drive system (a mechanism using a reciprocating bearing), a more compact design has been achieved by arranging the armature shaft in parallel with the cylinder axis. Referring to Fig. 3, the armature's rotation is transmitted to the second shaft via the first gear. The second shaft's rotation is then transmitted through a spline to the clutch, which engages with a reciprocating bearing and causes it to rotate. However, as illustrated, circular grooves on the inner race of the reciprocating bearing are positioned on an angle of inclination with relation to the second shaft. The rotation of the inner race and the shaft causes the angle of inclination to change regularly forward and back with relation to the second shaft, and produces a rocking motion in the outer race of the reciprocating bearing. Finally, a rod extending from the outer race of the reciprocating bearing is connected to the piston by a piston pin, and causes the reciprocating motion of the piston.

**Fig. 3**

- Hammering function

The piston reciprocates within the cylinder to move the striker in the same manner as in conventional rotary hammers. As the piston reciprocates, the changing air pressure inside the air chamber between the piston and the striker causes the striker to move and repeatedly strike against the end of the second hammer. At the same time, the changing air pressure within the air chamber which moves the striker also provides an "air cushion" which absorbs the impact of the hammering action. As any air leakage from the air chamber weakens the air-cushion effect and reduces impact absorption, the O-ring (mounted on the striker) is extremely important to seal the air. Although a special rubber material is utilized in construction of the O-ring to make its effective service life as long as possible, wear cannot be fully avoided. Accordingly, it is recommended that the O-ring be replaced approximately once a year, depending on the frequency of usage of the tool.

- Idle hammering prevention mechanism

The idle hammering prevention mechanism in the Model DH 24PC3 is different from that of conventional rotary hammers. When the drill bit is lifted from the work surface on completion of drilling, the second hammer moves to the position indicated by the continuous lines in Fig. 4 and the protruding (lip) portion at the tip of the striker is gripped by O-ring (C) mounted between the hammer holder and the damper holder. In this state, should the piston continue to move so that the small piston vent hole is blocked by the inner wall of the cylinder, the air in the air chamber will pass through the large piston vent hole and be released through the air-escape slot and large cylinder vent hole provided on the inner wall of the cylinder. Accordingly, there is no change in the air pressure within the air chamber, and movement of the striker (idle hammering operation) is prevented. The gripping force of O-ring (C) on the striker is so small in comparison with the conventional mouth system that practically no pressing force at all is required to restart the hammering operation.

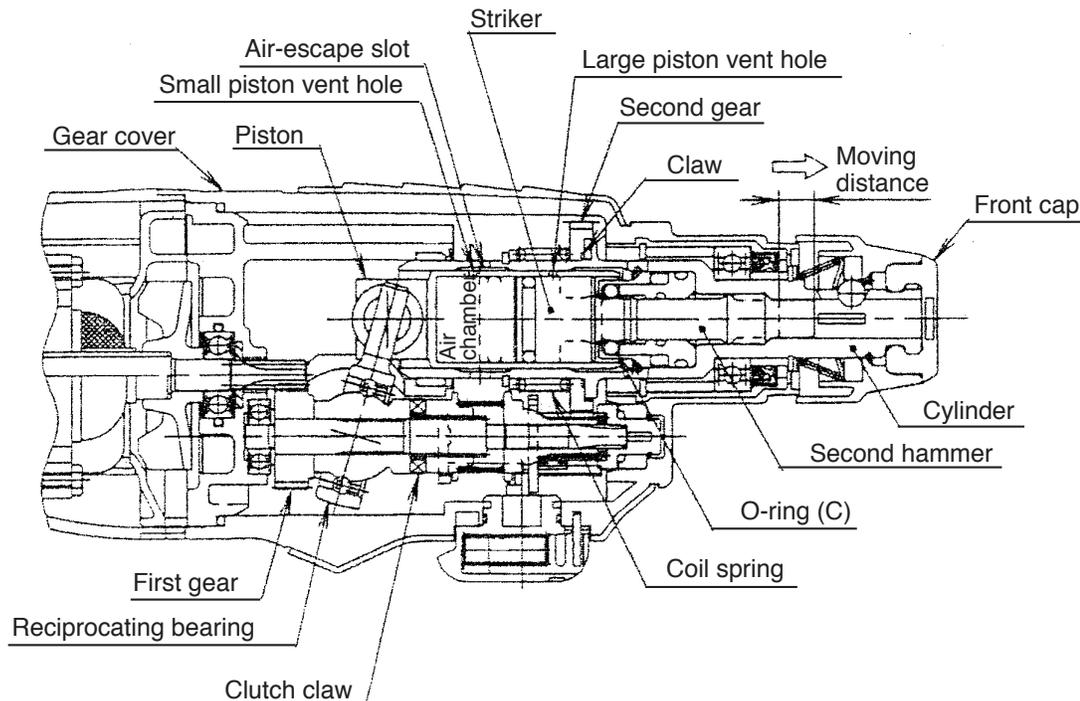

Fig. 4

- Slip mechanism

The slip mechanism in the Model DH 24PC3 consists of a coil spring which applies a pre-set amount of pressure to ensure the interlocking of three claws provided on the flange of the cylinder (the final rotating shaft) and six matching claws provided on the face of the second gear, by which rotation is transmitted to the cylinder. The second gear is fitted to the cylinder with a certain amount of play.

If an excessively large torque is applied to the tool shaft (cylinder), the force of the torque will exceed the pressure of the coil spring and cause the claws on the second gear to disengage from and ride over the claws on the cylinder so that the second gear idles and does not transmit rotation. Even if the drill bit comes in contact with a reinforcing bar within the concrete, causing sudden excessive torque, the slip mechanism functions to prevent damage to the gears, and possible loss of control of the tool by the operator.

- Sealed and dustproof construction

The gear cover is totally enclosed by oil seals, O-rings and other devices to prevent leakage of lubricating grease, and to keep dust and dirt out of the internal mechanisms. The drill bit chuck portion is protected by a rubber front cap to keep out dust and chips which could cause improper fitting of the drill bit and/or other faulty operation of the chuck portion. The speed control switch is also a fully dust-proofed type to prevent dust and chips from entering the handle section and causing possible operational trouble or a break down of the insulation.

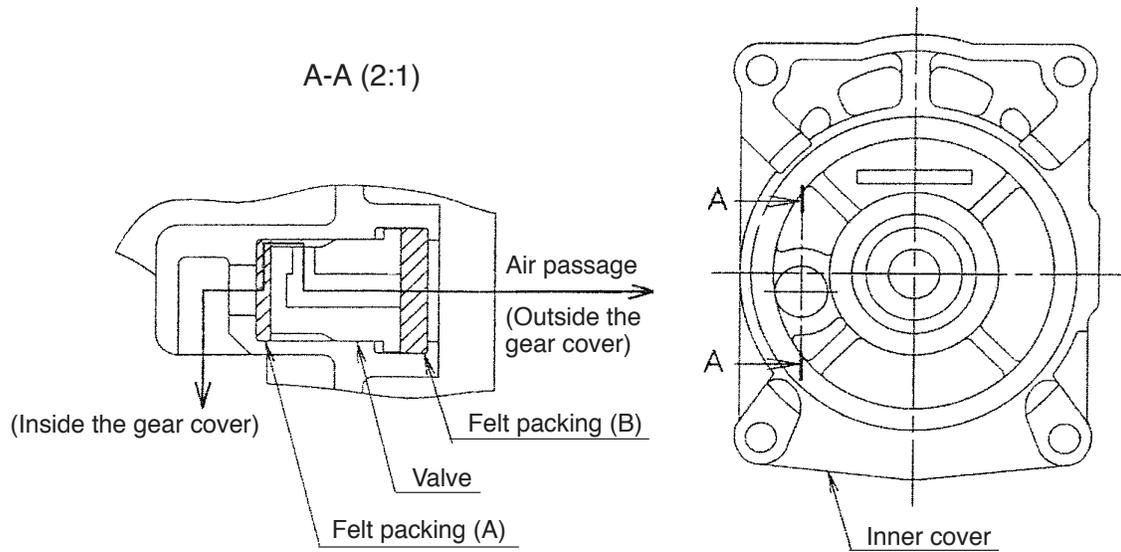

- Speed control

The Model DH 24PC3 is equipped with a variable speed control switch which permits free change of the rotation speed and hammering force. When drilling in fragile materials, pull the switch trigger gently for low rotation speed (hammering force) to achieve optimum results.

Note that the switch trigger cannot be pulled to the full but up to the half in the reverse drilling, and the speed is about half of the forward drilling. In addition, the switch stopper cannot be used in the reverse drilling.

- Internal pressure adjustment mechanism

An air passage is provided as shown in Fig. 5 to let out air inside the gear cover and let outside air in the gear cover. This passage is sandwiched between felt packings to pass only air (pressure). Thus variations in the internal pressure are minimized for stable hammering operation and prevention of idling and grease leakage.

**Fig. 5**

### 8-3. "Three-Mode" Changeover Mechanism

The change lever of the Model DH 24PC3 permits quick and easy changeover among the "rotation and hammering", "rotation only" and "hammering only" functions. Each function mode is explained below. When operating the change lever, be sure to continue pressing the pushing button.

#### (1) Rotation and hammering (Fig. 6)

Adjust the change lever to "rotation and hammering" (T marks). Armature rotation is transmitted to the first gear and second shaft, and then to the clutch via the spline of the second shaft. Claws on the end surface of the clutch engage with matching claws of the reciprocating bearing (A portion in the figure) to convert the rotation into reciprocating motion. Three claws on the tip of the second shaft engage with matching three claws of the pinion sleeve all the time, and the second shaft rotation is transmitted to the pinion sleeve. Then claws on the large-dia. portion of pinion sleeve engage with the second pinion (B portion in the figure), and the rotation is transmitted to the second gear and the cylinder.

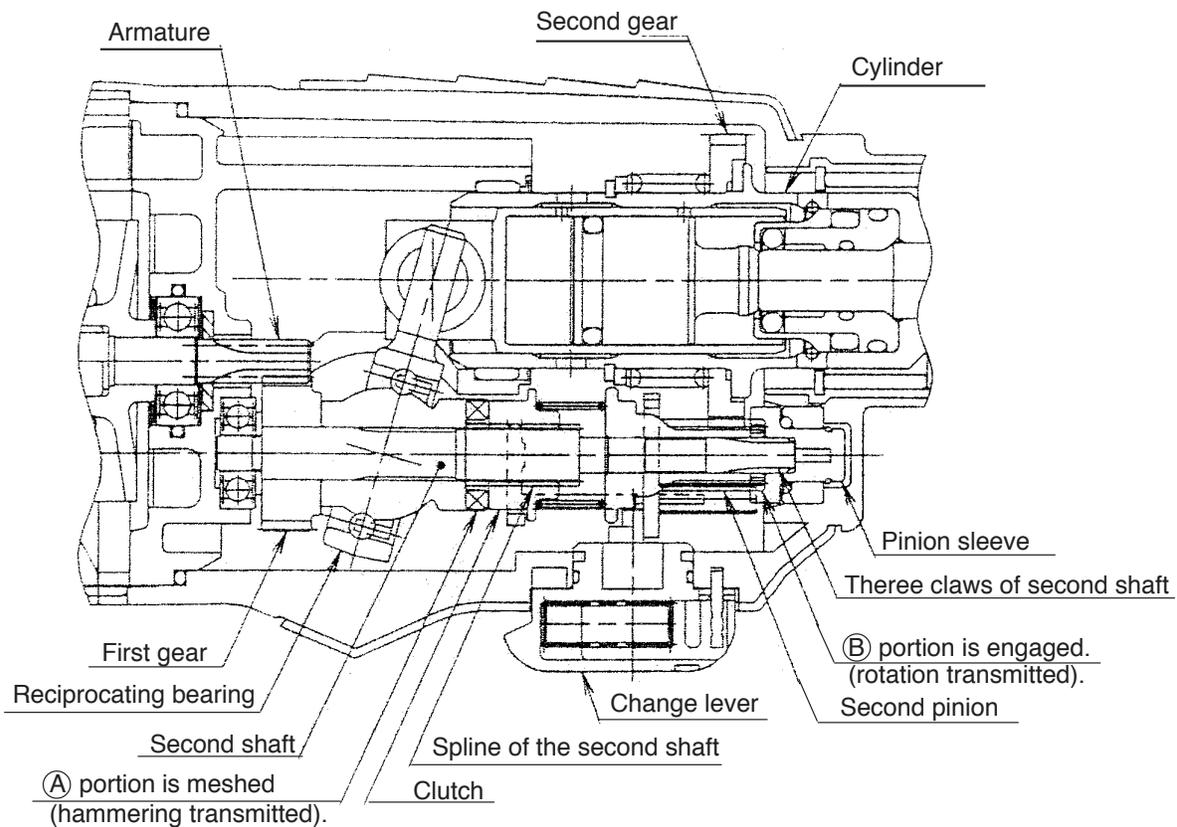

Fig. 6

(2) Rotation only (Fig. 7)

Adjust the change lever to "rotation only" (⊞ mark). The lock plate is moved forward by the pin of the change lever, and the clutch is moved forward at the back end of the lock plate. Engagement between the clutch and the claws of the reciprocating bearing is released (Ⓐ portion in the figure). Thus no rotation is transmitted to the reciprocating bearing and hammering is stopped. On the other hand, the pinion sleeve engages with the second pinion (Ⓑ portion in the figure), and so the rotation is transmitted to the pinion sleeve for "rotation only" function.

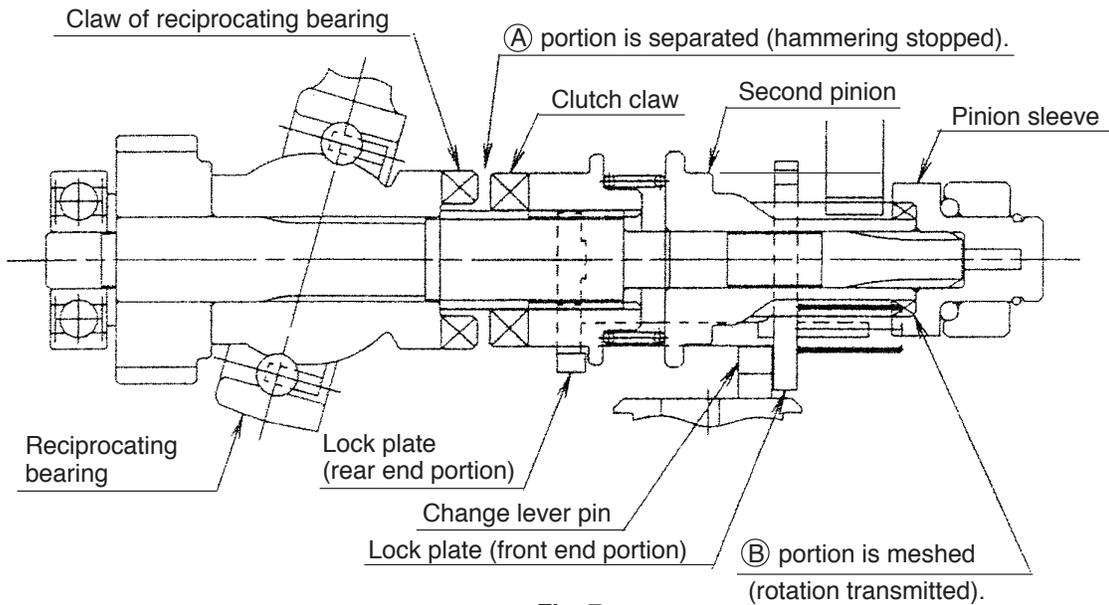

Fig. 7

(3) Hammering only (Fig. 8)

Adjust the change lever to "hammering only" (⊞ mark). The second pinion is moved to the motor side by the pin of the change lever. Engagement between the pinion sleeve and the second pinion is released and no rotation is transmitted (Ⓑ portion in the figure). The lock plate is moved to the motor side by spring (B) and engaged with the locking claw of the second pinion to lock the cylinder rotation (Ⓒ portion in the figure). On the other hand, the clutch engages with the reciprocating bearing for "hammering only" function (Ⓐ portion in the figure).

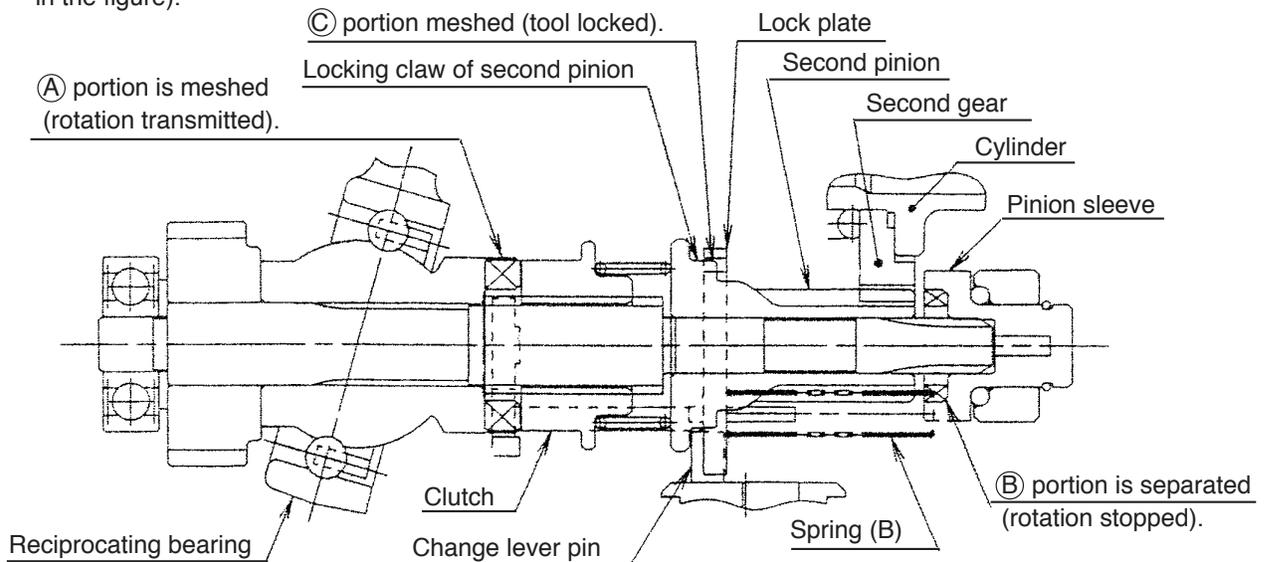

Fig. 8

(4) Neutral (Fig. 9)

The Model DH 24PC3 has a neutral mode used for positioning a tool such as a flat chisel. Adjust the change lever to a position halfway between "hammering only" (T mark) and "rotation and hammering" (T H marks). Engagement between the pinion sleeve and the second pinion (B portion in the figure), and between the lock plate and the locking claw of the second pinion (C portion in the figure) is released and the cylinder rotates freely. Simply turn the grip to adjust the tool to the desired position.

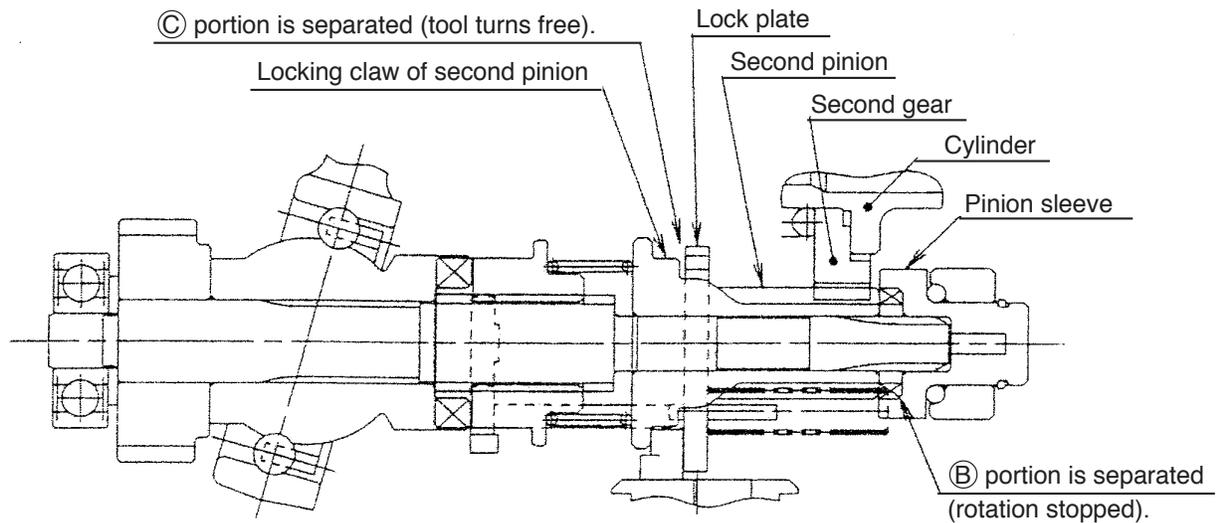

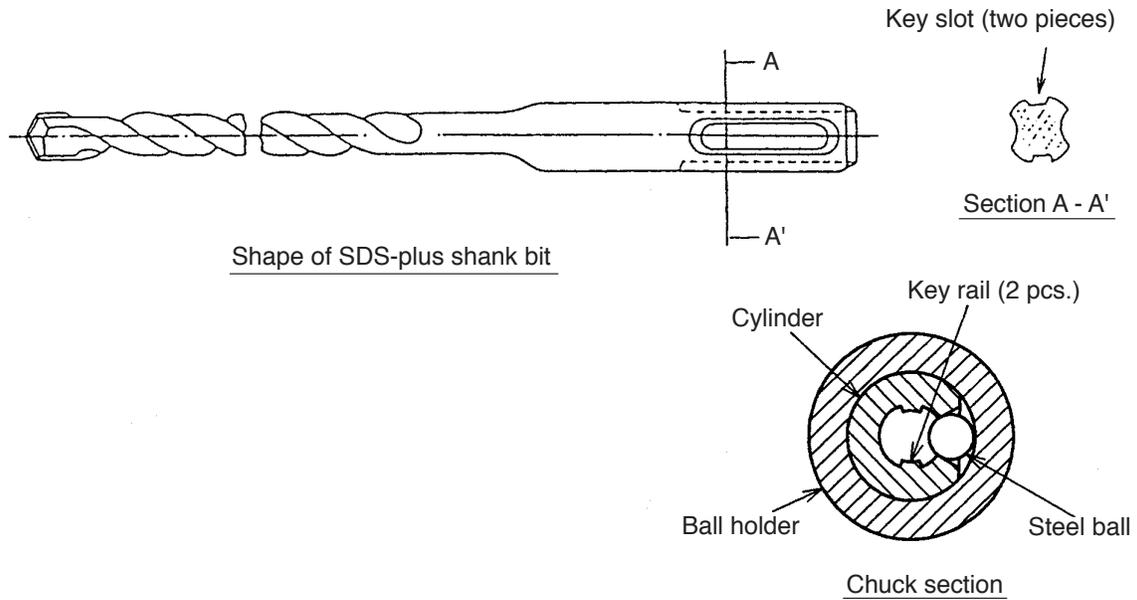

Fig. 9

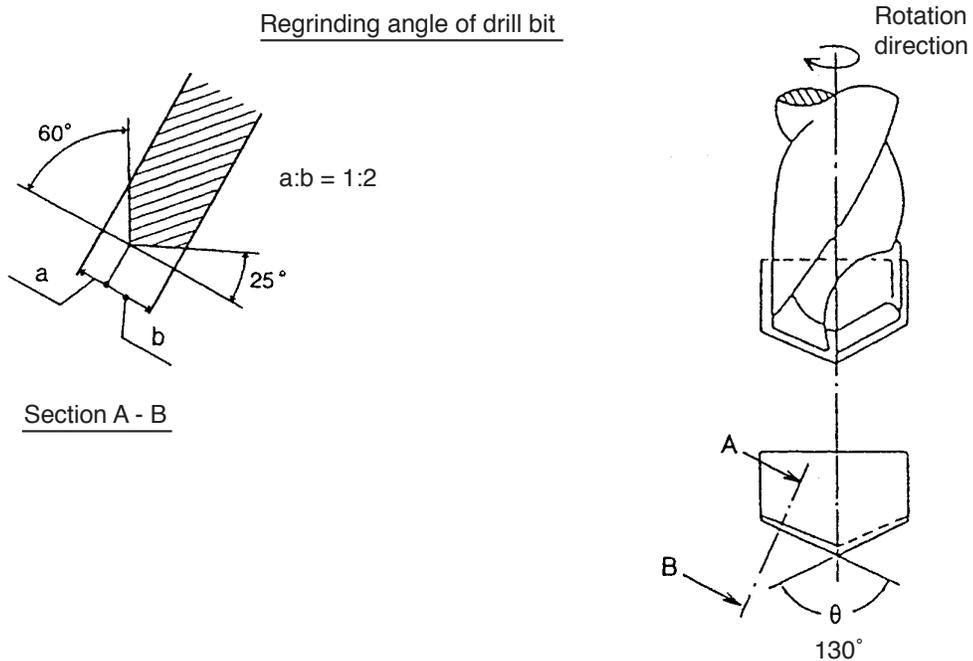

### 8-4. Drill Bits

The chuck section is designed exclusively for the popular and widely available SDS-plus shank bits, as shown in Fig. 10. Rotating torque is transmitted to the drill bit by two key rails provided in the tool holding section. A steel ball is used to prevent the bit from coming off.

**Fig. 10**

The service life of a drill bit with a diameter of 8 mm is approximately 300 holes when drilling into concrete to a depth of 30 mm. If reground before the end of its service life, the drill bit will continue to provide efficient drilling. Figure 11 shows the regrinding angle.

**Fig. 11**

## 8-5. Chuck Section

The tool retainer is structured as shown in Fig. 12.

The tip of the tool retainer is covered with the front cap (made of rubber) to prevent dust and chips from getting inside. The steel ball falls into the round groove of the bit to prevent the tool from coming off and the two key rails transmit the rotation torque.

To mount the bit, push the bit in the tool retainer as far as it will go. Pushing lightly, turn the bit until it is caught.

At this position, push the bit in as far as it will go (sliding the grip is not required for mounting the bit). To remove the bit, slide the grip backward to the full and remove the bit.

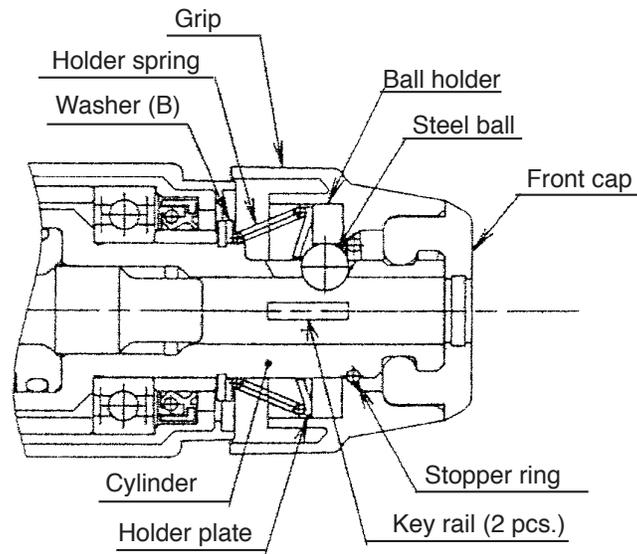

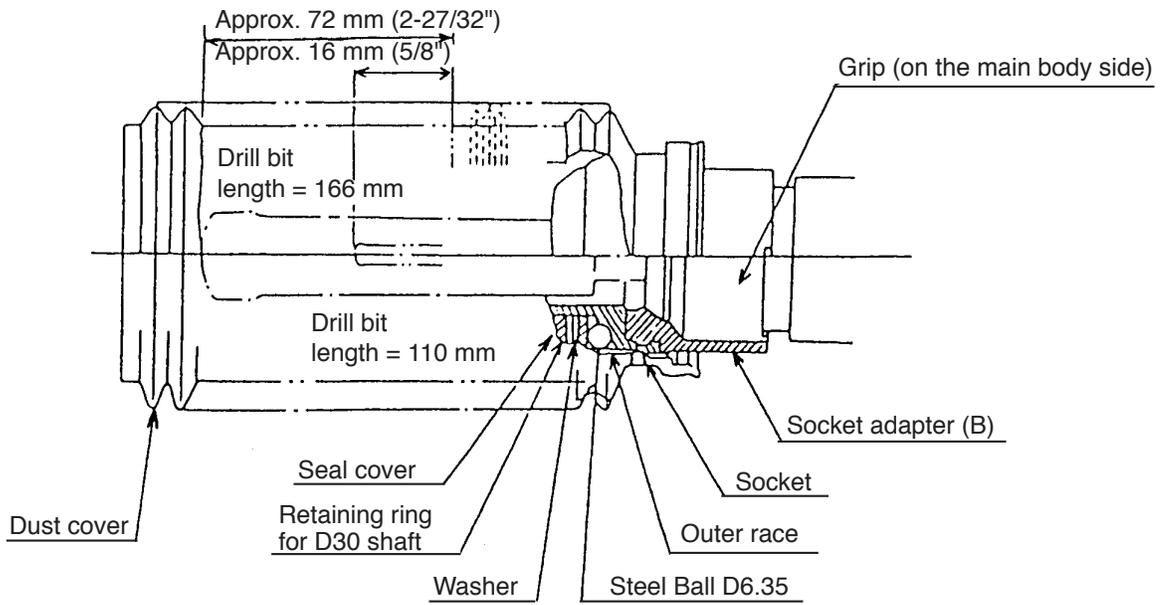

Fig. 12

## 8-6. Dust Collector (B)

When drilling holes overhead, dust collector (B) can be mounted on the Model DH 24PC3 to prevent dust and chips from falling downward. Dust collector (B) is intended solely for use when drilling holes in concrete, and cannot be used for drilling holes in steel or wood. It is designed for use with drill bits with overall lengths of 110 mm, 160 mm and 166 mm, and cannot be used with any longer bits. When using a drill bit with an overall length of 166 mm with dust collector (B), drilling up to a depth of approximately 72 mm is possible. When using dust collector (B), ensure it is securely fastened to the grip on the main body with socket adapter (B). Although the socket and socket adapter (B) rotate together with the tool shank, there is a steel ball between the outer race and the socket which serves as a ball bearing. Should the dust cover be forced against the concrete surface, it will not rotate even though the tool shank continues to rotate. Should the tool be operated when the dust cover is not being held against a concrete surface, inertia may cause dust collector (B) to become disconnected from the grip. Accordingly, caution the customer to press dust collector (B) and drill bit firmly against the concrete surface before turning on the switch to start drilling.

When dust collector (B) is used, almost no dust and chips are scattered about. However, since the chips and dust remaining in the collector may scatter after completion of the drilling operation, the customer should be advised to always wear protective glasses.

When dust collector (B) is disassembled for repair or maintenance, be very careful to prevent oil or grease from adhering to the steel balls. Grease or oil on the steel balls may cause concrete dust to enter the unit and cause defective rotation.

**Fig. 13 Dust collector (B) structure**

## 9. PRECAUTIONS IN DISASSEMBLY AND REASSEMBLY

The **[Bold]** numbers in the descriptions below correspond to the item numbers in the Parts List and exploded assembly diagram.

### 9-1. Disassembly

(1) Disassembly of the striking mechanism section

- Push the Second Hammer **[29]** in the main body with a drill bit or screwdriver to release the Striker **[37]** from O-ring (C) **[34]**.
- Pressing the Pushing Button **[18]**, move the Change Lever **[21]** to the "hammering only" mode (  $\bar{T}$  mark). (Be sure to keep pressing the Pushing Button **[18]** when operating the Change Lever **[21]**.)
- Loosen the four Tapping Screws (W/Flange) D5 x 35 **[9]**, and remove the Gear Cover Ass'y **[10]**. The Inner Cover Ass'y **[41]** and the Housing **[68]** are loosely fitted together. Attempting to pull them out first could cause the Armature **[62]** to be pulled out at the same time, causing damage to the Carbon Brushes (Auto Stop Type) **[74]**.
- Remove Spring (B) **[22]** from the rails in the Gear Cover Ass'y **[10]** as shown in Fig. 14.
- Pull out the Second Pinion **[49]**, Clutch Spring **[50]**, Clutch **[51]** and the Lock Plate **[48]** (these parts are sandwiched by means of the Lock Plate **[48]** as a unit as shown in Fig. 15) from the end of the Second Shaft **[52]**. Turn the Reciprocating Bearing **[53]** so that the Piston **[39]** is moved to its maximum upper position (Inner Cover Ass'y **[41]** side). The arm of the Reciprocating Bearing **[53]** can then be disconnected from the Piston Pin **[42]**, and the Second Shaft **[52]** and the components mounted on it can be removed from the Inner Cover Ass'y **[41]** as a unit.
- Remove the First Gear **[54]** from the Second Shaft **[52]** with a bearing puller. Then take off the Reciprocating Bearing **[53]**. At this time, take care not to damage the end surface of the Second Shaft **[52]** because the First Gear **[54]** is press-fitted in alignment with the 9 mm diameter end surface of the Second Shaft **[52]**.

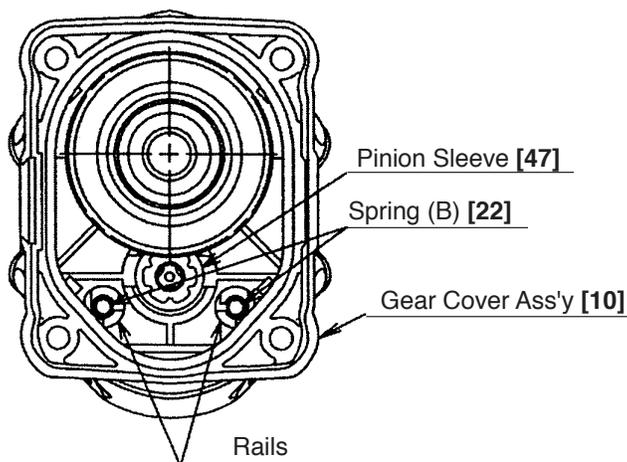

Fig. 14

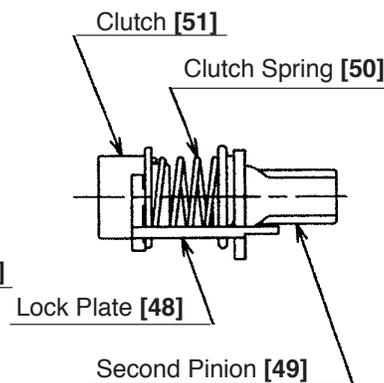

Fig. 15

(2) Disassembly of the Change Lever

As shown in Fig. 16, pressing the Pushing Button [18] hard, turn the Change Lever [21] 45° counterclockwise from the "hammering only" position ( T mark). Pry out the Change Lever [21] at this position.

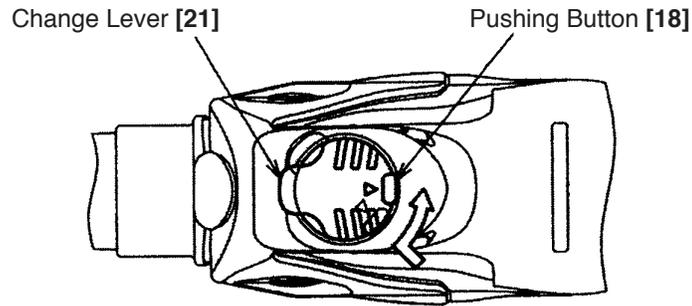

Fig. 16

(3) Disassembly of the tool retainer

Slide the Grip [3] fully in the arrow direction as shown in Fig. 17 and remove the Front Cap [1]. Pulling the Grip [3] as shown in Fig. 18, remove the Stopper Ring [2] with a retaining ring puller. Then the Grip [3], Ball Holder [4], Steel Ball D7.0 [23], Holder Plate [5], Holder Spring [6] and Washer (B) [7] can be removed from the Cylinder [24].

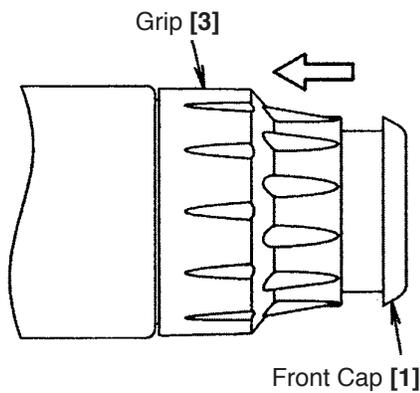

Fig. 17

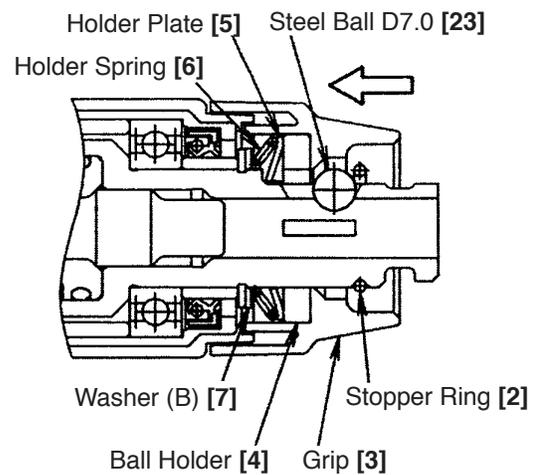

Fig. 18

(4) Removal of the cylinder and the second gear (slip mechanism section)

Remove the Gear Cover Ass'y [10] from the Inner Cover Ass'y [41] and remove the entire tool retainer. Remove the Retaining Ring for D20 Shaft [8] with a retaining ring puller. Stand the Gear Cover Ass'y [10] in this state and pull out the Cylinder [24] from the Gear Cover Ass'y [10] with a hand press. Then the Sleeve [13] can be removed from the Cylinder [24]. Remove the Retaining Ring D30 [28] from the Cylinder [24] with a retaining ring puller. Then the Second Gear [25], Spring (A) [26] and Washer (A) [27] can be removed from the Cylinder [24].

(5) Removal of the cylinder and the second hammer

Remove the Stopper Ring [36] from the inside diameter portion of the Cylinder [24]. Then the Second Hammer [29], O-ring (1AP-20) [30], Hammer Holder [31], O-ring (B) [32], Damper (A) [33], O-ring (C) [34] and Damper Holder [35] can be removed from the Cylinder [24]. As shown in Fig. 19, insert the no-hole side of stopper ring jig (A) (J-341) into the Cylinder [24] until it contacts the end surface of the Damper Holder [35]. Hold the Cylinder [24] and the end surface of stopper ring jig (A) (J-341) with a vise, and compress Damper (A) [33] (it moves a little when the Stopper Ring [36] is pressed with punch (C) (J-341)). Insert punch (C) (J-341) into the 5-mm diameter hole (2 places) in the Cylinder [24] and tap the outside of the Stopper Ring [36] until the Stopper Ring [36] cannot be seen from the 5-mm diameter hole (2 places) to remove the Stopper Ring [36] from the groove of the inside diameter portion of the Cylinder [24]. Then remove the Cylinder [24] from the vise and pull out the Stopper Ring [36] from the inside diameter portion of the Cylinder [24] with ring puller jig (B) (J-341) being careful not to pop out the Stopper Ring [36]. At reassembly, replace the Stopper Ring [36] with new one as the removed Stopper Ring [36] is deformed. To prevent idle hammering, also replace O-ring (C) [34] with new one at reassembly.

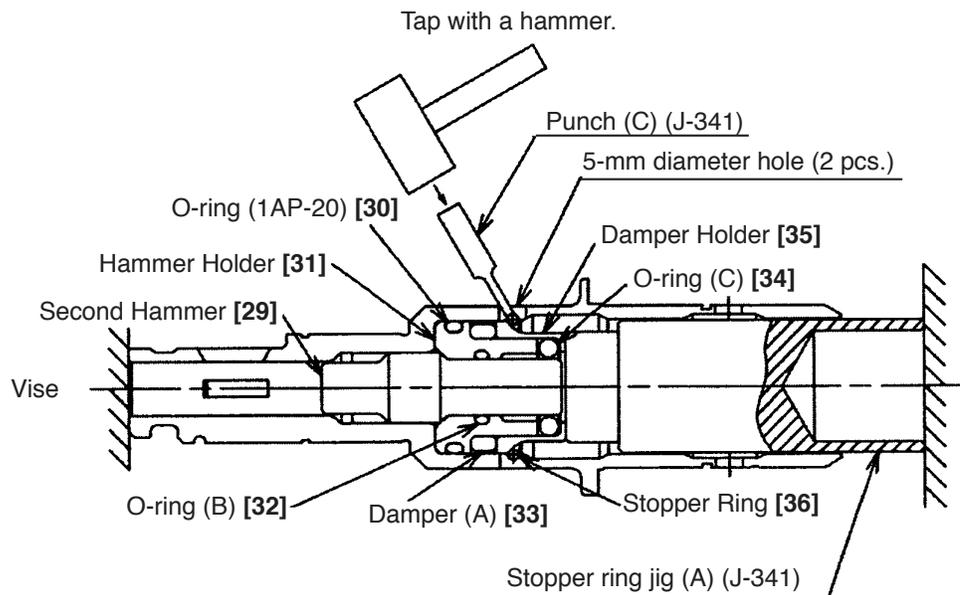

Fig. 19

(6) Removal of the gear cover and the pinion sleeve

Pinch the Pinion Sleeve [47] with the pinion sleeve puller (J-302, No. 319265) and fix the pinion sleeve puller to a vise. Pull the Gear Cover Ass'y [10] to remove the Pinion Sleeve [47] from the Gear Cover Ass'y [10] (Figs. 20 and 21).

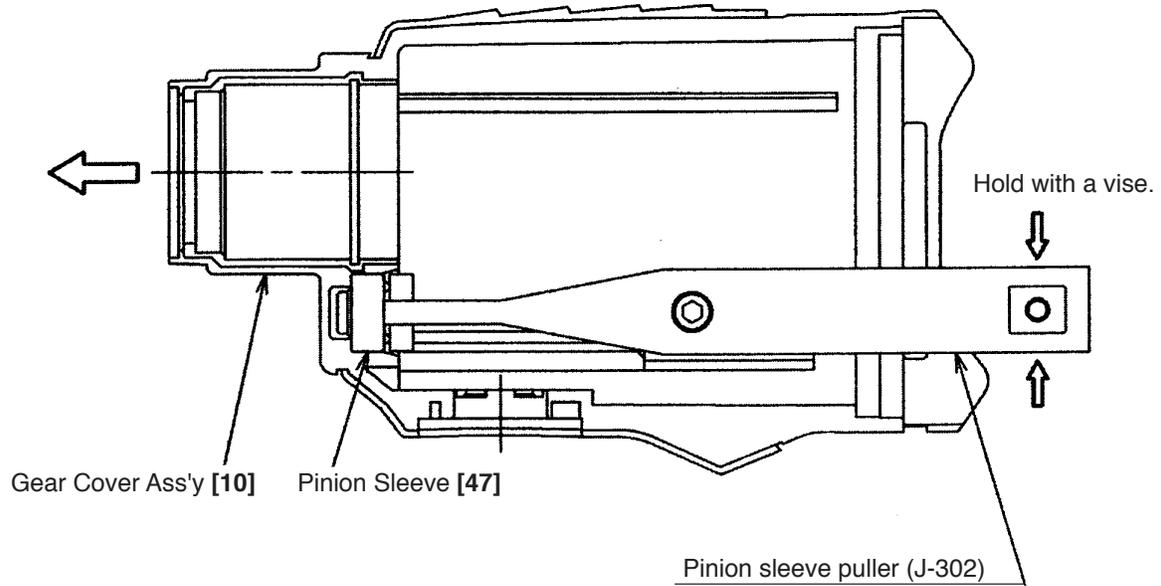

Fig. 20

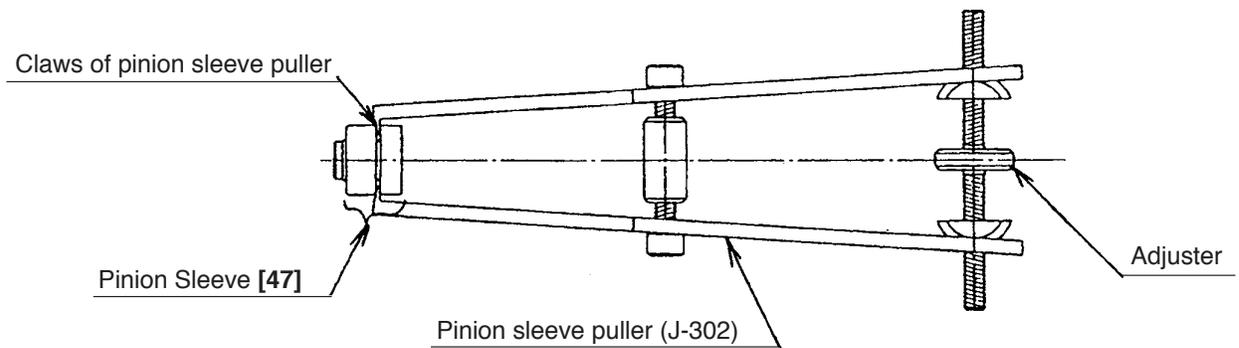

Fig. 21

## 9-2. Reassembly

Reassembly can be accomplished by following the disassembly procedure in reverse. However, special attention should be given to the following items.

### (1) Application of lubricant

Apply special grease (for hammer and hammer drill) to the O-ring (1AP-20) [30] and O-ring (B) [32] for the Hammer Holder [31], Damper (A) [33], O-ring (C) [34], O-ring (I.D. 16) [38] for the Striker [37], outer circumference of the Striker [37], inner and outer circumference of the Piston Pin [42], outer circumference of the Piston [39], Reciprocating Bearing [53], Reciprocating Bearing [53] rotary shaft of the Second Shaft [52], Second Pinion [49] rotary shaft, clutch claw of the Cylinder [24], inner circumference of the metal of the Inner Cover Ass'y [41], Second Hammer [29], and the lip portion of the Oil Seal [12]. Fill 45 g of the special grease in the gear cover and 5 g in the inner cover groove. Apply Molub Alloy No. 777-1 grease to the pin portion of the Change Lever [21]. Apply Molub Alloy No. 777-1 grease to the contact portion between the Clutch [51] and the Lock Plate [48]. Fill Molub Alloy No. 777-1 grease in the ball portion of the Reciprocating Bearing [53]. Apply Hitachi Motor Grease No. 29 to the O-ring (S-18) [20] for the Steel Ball D7.0 [23] and the Change Lever [21].

### (2) Mounting the Cylinder [24]

Mount the Second Hammer [29], O-ring (1AP-20) [30], Hammer Holder [31], O-ring (B) [32], Damper (A) [33], new O-ring (C) [34] and Damper Holder [35] in the Cylinder [24]. Push the new Stopper Ring [36] in the Cylinder [24] then push in the hole side of stopper ring jig (A) (J-341) on it as shown in Fig. 22. Push the upper end surface of stopper ring jig (A) (J-341) with a hand press to fit the Stopper Ring [36] in the groove of the inside diameter portion of the Cylinder [24]. Check that the Stopper Ring [36] is securely fitted in the groove of the inside diameter portion of the Cylinder [24] viewing from the 5-mm diameter hole (2 pcs.) on the Cylinder [24].

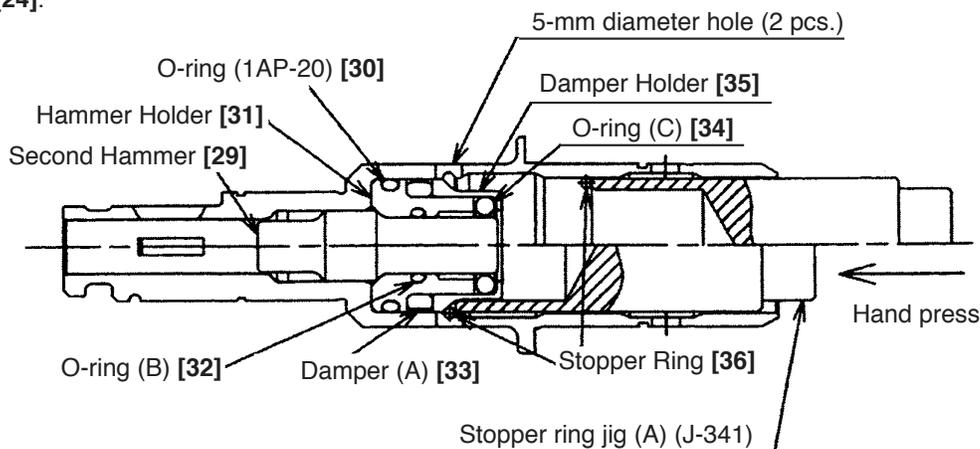

Fig. 22

(3) Reassembly of the change lever

Press the Pushing Button [18] deeply into the hole of the Change Lever [21]. Adjust the Change Lever [21] to the position shown in Fig. 23 of the Gear Cover Ass'y [10] and press it hard. Then move the Change Lever [21] to the "hammering only" position (T mark).

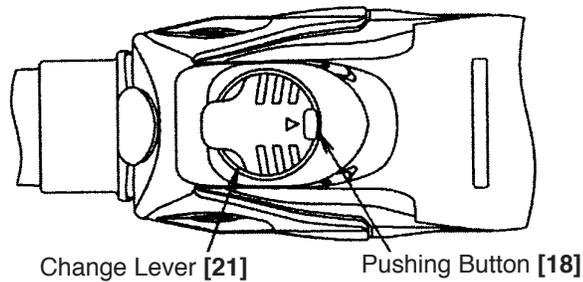

Fig. 23

(4) Press-fitting the first gear

Press-fit the First Gear [54] aligning with the shaft end surface of the Second Shaft [52]. After press-fitting the First Gear [54], check that the inside ring of the Reciprocating Bearing [53] turns smoothly.

(5) Reassembly of the oil seal

Prior to reassembly, apply grease to the inner circumference of the Oil Seal [12]. However, do not apply grease to its outer circumference. Also, when press-fitting the Oil Seal [12], ensure that it is straight and level.

(6) Reassembly of the internal pressure adjustment mechanism

Push Felt Packing (A) [44], Valve [45] and Felt Packing (B) [46] in the Inner Cover Ass'y [41] as far as they will go in this order.

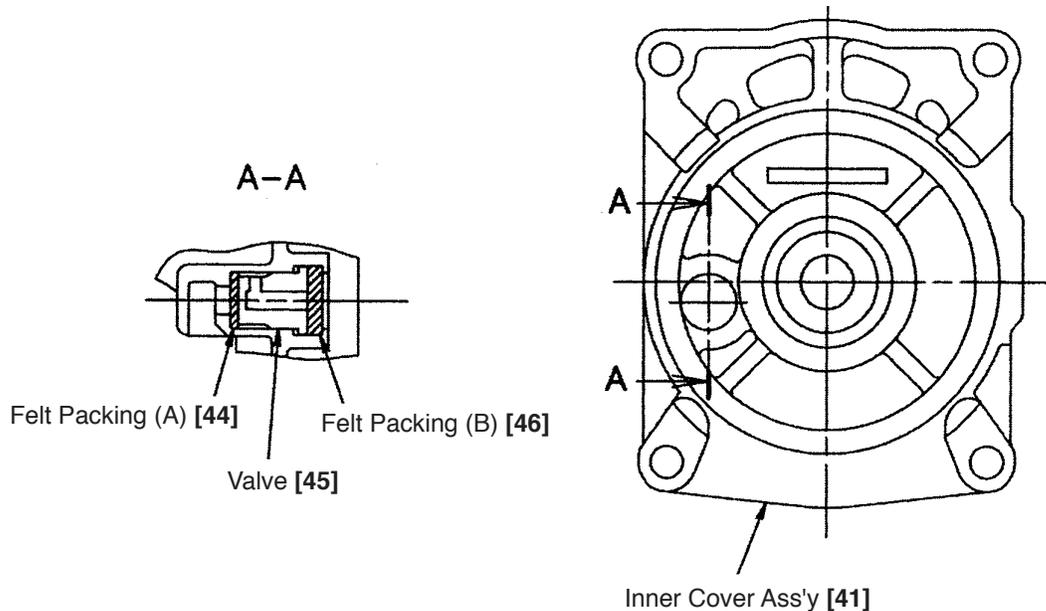

Fig. 24

(7) Mounting the piston

Mount the Piston [39] as shown in Fig. 25.

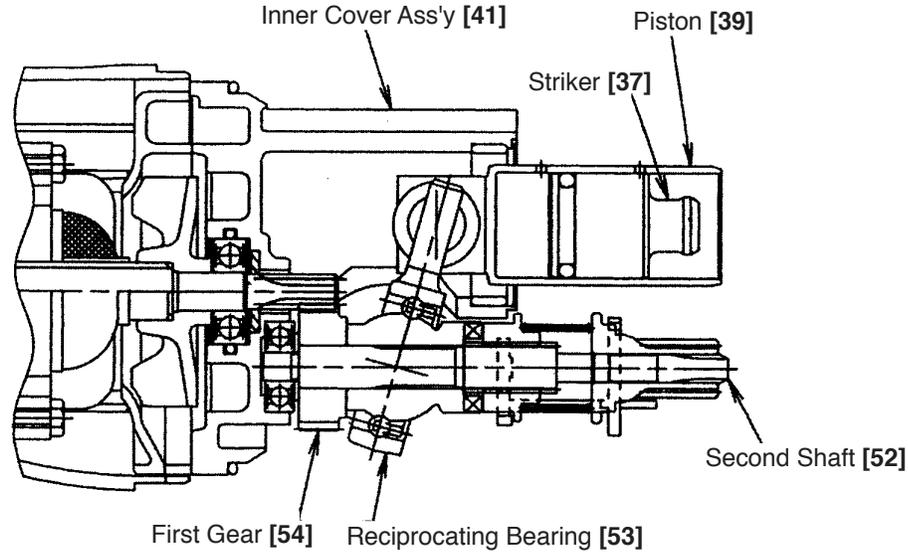

Fig. 25

(8) Reassembly of the gear cover

After reassembly as shown in Fig. 26, ensure that the Change Lever [21] is adjusted to the "hammering only" position. Engage the claws of the Clutch [51] and the Reciprocating Bearing [53] each other. Align the wing portion of the Lock Plate [48] horizontally and reinstall the Gear Cover Ass'y [10] so that the wing portion of the Lock Plate [48] is contained in the rail inside of the Gear Cover Ass'y [10]. When the Second Shaft [52] contacts the Pinion Sleeve [47] inside the Gear Cover Ass'y [10], move the Change Lever [21] to the "rotation and hammering" mode and rotate the Grip [3]. Then the Second Shaft [52] and the Pinion Sleeve [47] are engaged and the end surface of the Gear Cover Ass'y [10] contacts that of the Housing [68]. At this time, rotate the Grip [3] to check that the rotation of the Cylinder [24] is transmitted to the armature shaft.

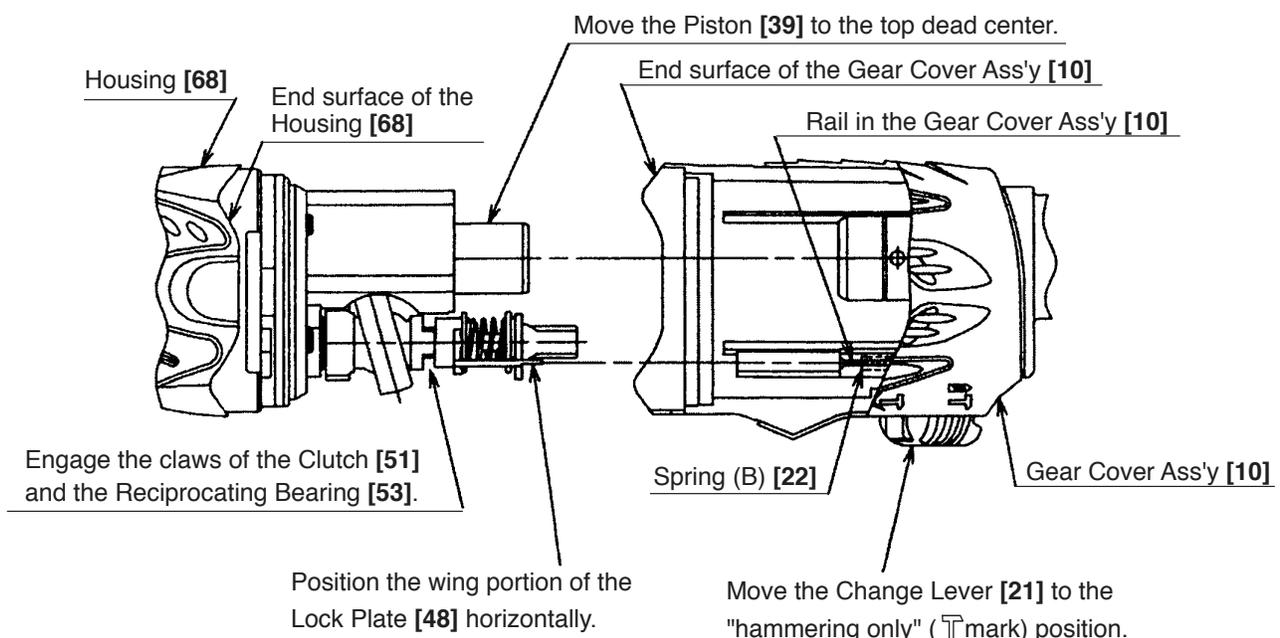

Fig. 26

### 9-3. Tightening Torque

Tapping Screws D4 [64] [82] .....	2.0 ± 0.5 N·m (20 ± 5 kgf·cm, 17.4 ± 4.3 in-lbs.)
Tapping Screws (W/Flange) D5 X 35 [9] .....	2.9 ± 0.5 N·m (30 ± 5 kgf·cm, 26.0 ± 4.3 in-lbs.)

### 9-4. Wiring Diagrams

(1) Product with noise suppressor

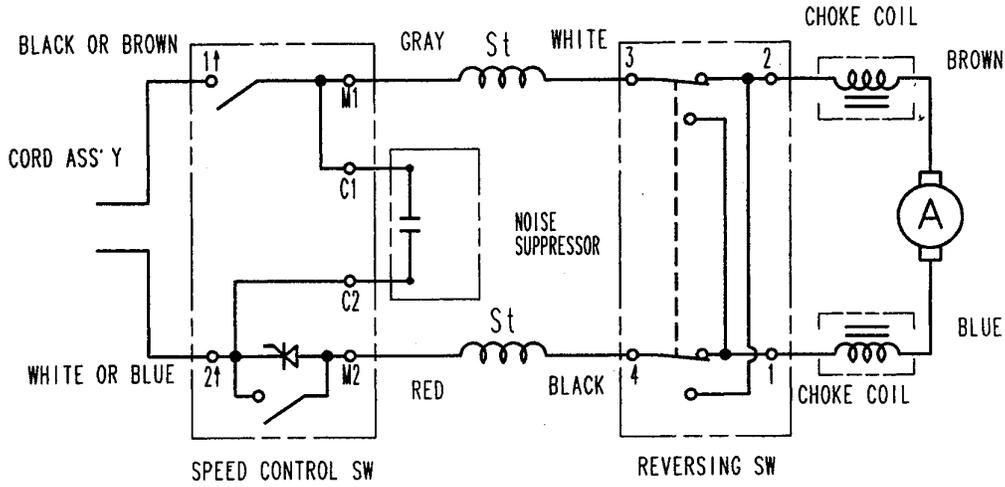

Fig. 27

(2) Product without noise suppressor

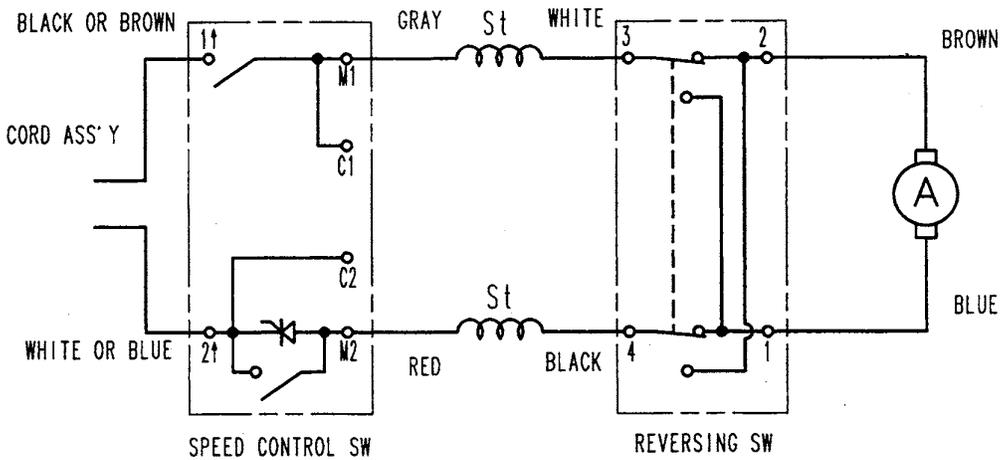

Fig. 28

## 9-5. Internal Wire Arrangement and Wiring Work

### A. Internal wire arrangement

#### (1) Product with noise suppressor

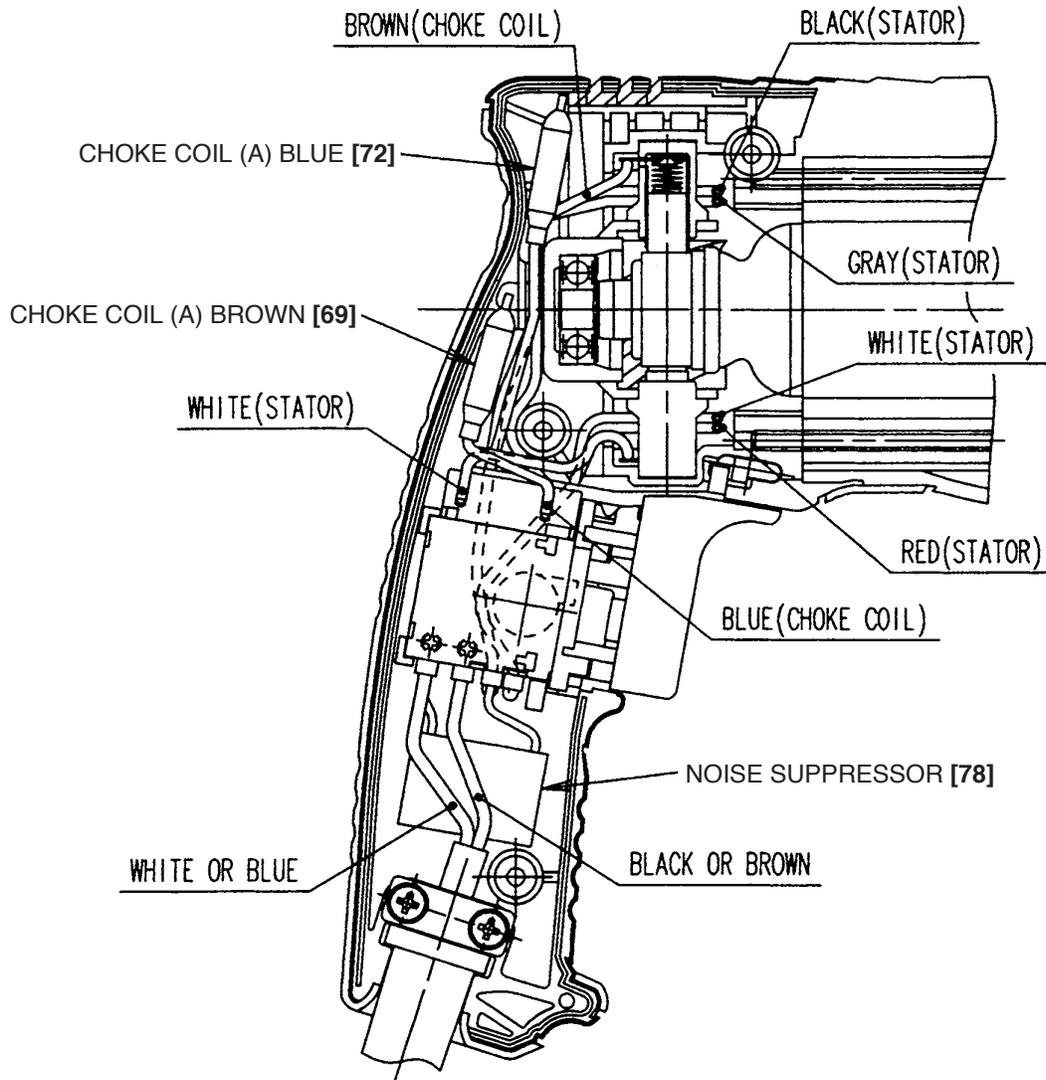

Fig. 29

(2) Product without noise suppressor

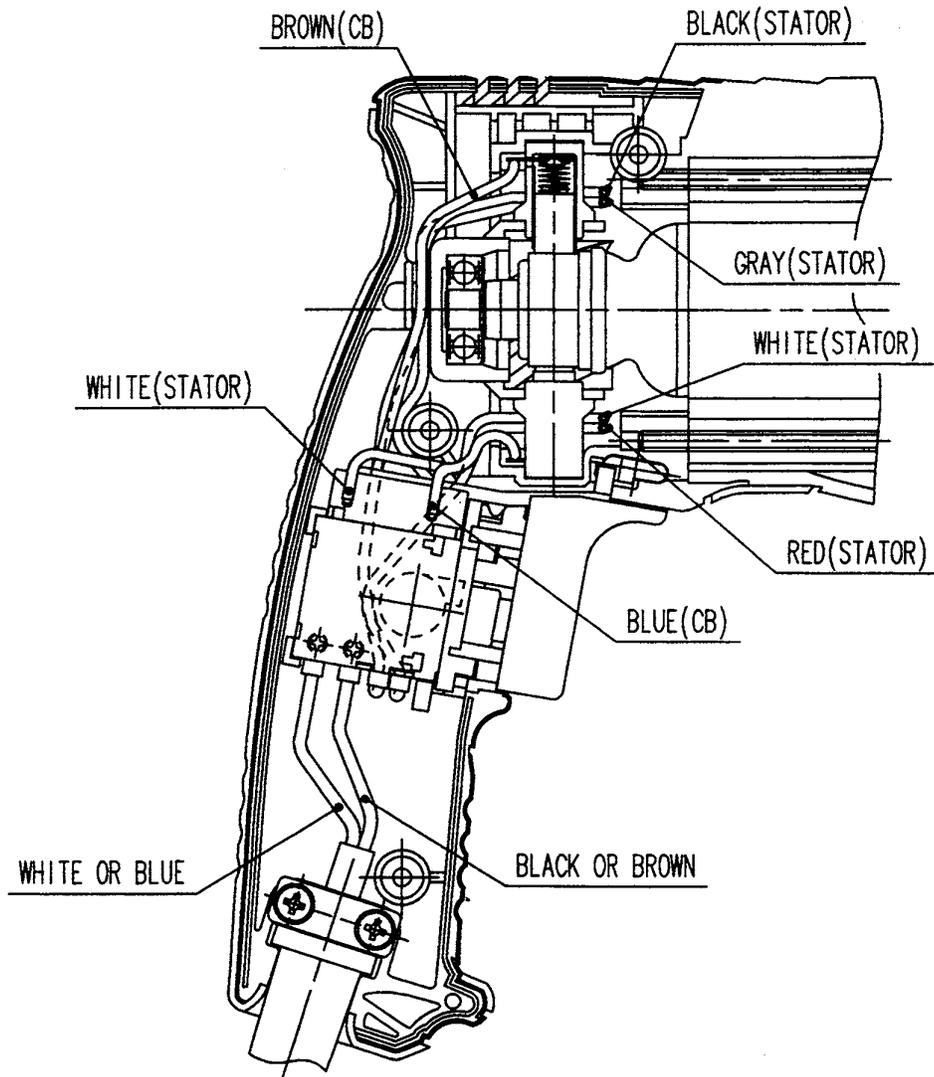

Fig. 30

## B. Additional wiring work

General internal wiring can be accomplished by referring to paragraphs 9-4 and 9-5-A. The following are special instructions for switch connection.

### (1) Wiring of reversing switch

Insert the lead wire (black) coming from the stator into the terminal (4) of the reversing switch, and the lead wire (white) into the terminal (3) as shown in Fig. 31.

Insert the lead wire (brown) coming from the carbon brush or choke coil into the terminal (2) and the lead wire (blue) into the terminal (1). After insertion, pull each lead wire slightly to check that the lead wires do not come off. To disconnect the lead wires, insert a small flat-blade screwdriver into the windows near the terminals and pull out the lead wires.

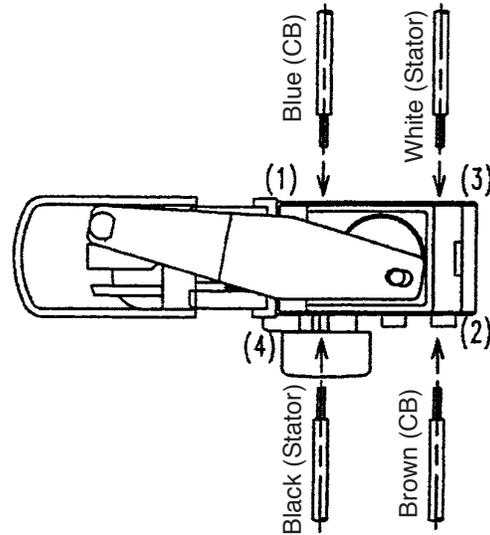

Fig. 31 Wiring of reversing switch

### (2) Wiring of speed control switch

Insert each cord into the terminal 1† and terminal 2† of the speed control switch as shown in Fig. 32 and tighten the screw [tightening torque:  $0.6 \pm 0.2$  N·m ( $6 \pm 2$  kgf·cm,  $5.2 \pm 1.7$  in·lbs.)]. Insert the lead wire (gray) coming from the stator into the terminal M1 and the lead wire (red) into the terminal M2. Insert each lead wire (white) coming from the noise suppressor into the terminal C1 and C2.

After insertion, pull each lead wire slightly to check the lead wires do not come off. To disconnect the lead wires, insert a small flat-blade screwdriver into the windows near the terminals and pull out the lead wires.

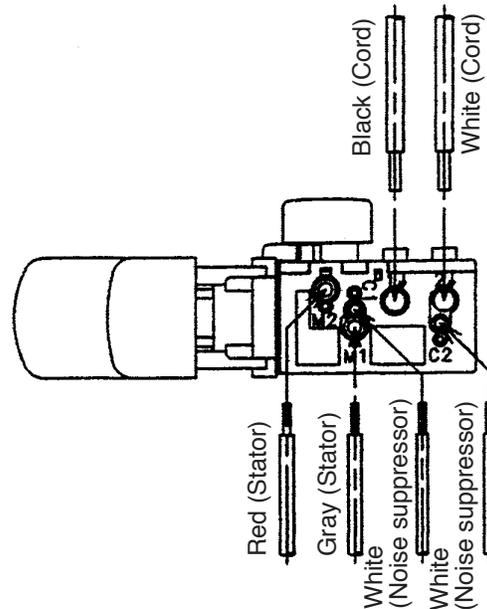

Fig. 32 Wiring of reversing switch

## 9-6. Insulation Tests

On completion of disassembly and repair, measure the insulation resistance and conduct the dielectric strength test.

Insulation resistance: 7 M  $\Omega$  or more with DC 500 V megohm tester

Dielectric strength: AC 4,000 V/1 minute, with no abnormalities 220 V – 240 V (and 110 V for U.K. products)  
AC 2,500 V/1 minute, with no abnormalities 110 V – 120 V (except U.K. products)

## 9-7. No-load Current Values

After no-load operation for 30 minutes, the no-load current value should be as follows:

Voltage (V)	110	120	220	230	240
Current (A) max.	3.6	3.3	1.8	1.7	1.6

### 10. STANDARD REPAIR TIME (UNIT) SCHEDULES
